Lonorable J. Lee Rankin General Counsel The President's Commission 200 Huryland Avenue, Northeast Washington, D. C. 20002

Dear Mr. Rankin:

105 82555

Reference to made to your letter of February 4, 1954, inquiring as to the basis for the conclusions with respect to the identification of the bullets and cartridge cases in this matter and concerning the metal fragments from the President'o ligad.

Fircarins identifications such as those made on the bullet and cartridge case evidence in the Oswald matter are based upon a microscopic study of the Individual characteristic markings impressed in the surfaces of the bullets and cartridge cases by the mechanism of the weapon and upon a microscopic comparison of these markings with those produced on test specimens fired from the suspected weapon. Since the markings left by a weapon on a bullet or cartridge case are characteristic of that weapon, a suspected bullet or cartridge case bearing such markings, in general, can definitely be identified as having been fired rom a particular weapon. These identifications are thus based on sound scientific principles which have been accepted in court for many years.

The motal fragments from the President's head are very small pieces of lead which bair no markings that could be used for identification purposes and, there pro, there is no basis on which they could definitely be associated with any vicine a. It is noted in this regard that the rifle bullets involved in this matter consided of a loud core surrounded by a copper alloy jacket; the identifying marks In gua brarel in such a situation appear only on the metal jacket and not on the lead core or fregments of the lead core.

(see note on page

Hondrable J. Lee Rankin

In the list of specimens on page one of your letter, it was noted that specimen Q8 was described as a cartridge case. Actually, this specimen was described in Special Agent Gemberling's report dated November 30, 1963, as a cartridge and is in fact an unfired cartridge.

Sincerely yours,

J. Edgar Hoover.

NOTE: The bullet found on the stretcher at the hospital, specimen Ql, and the large bullet fragments, Q2 and Q3, found in the President's automobile were identified in the Laboratory as having been fired from the Mannlicher-Carcano rifle submitted in this case and which was identified as belonging to Oswald. The three cartridge cases found in the Texas School Book Depository Building were definitely identified in the Laboratory as having been fired in the submitted rifle. Several cartridge cases recovered in connection with the shooting of Officer Tippett were identified as having been fired in the .38 Special Smith and Weason revolver, SN V510210.

The tiny lead fragments removed from the President's head bore no markings suitable for identification purposes. To further our study in respect to these small fragments, a spectrographic examination was made of them and they were found to be composed of a bullet alloy comparable in composition to the core of the fragments from the President's automobile; however, this is not sufficient to definitely establish that they are from a bullet fired from Oswald's gun.
