Note to Parkland Drs and JFK's Woundes

Key: Specter's use of the hypothetical when questioning the Parkland drs and nurses

He needs them to acquiesce to the proposition that a high-powered rifle bullet entering at the base of the neck and transiting soft tissue could exit at the throat and produce a wound that had the characteristics of a wound of entrance.

DRs who respond to this and agree to the possibility are:

Akin VI < 66

Baxter, VI 42

Carrico VI. 5

Jenkins, VI 50

Jones, VI, 55 Note Jones' qualifications

McClelland VI, 38.

Perry, VI, 15

Point here: Plays off of Jones' qualification. If it was a bullet from a high-powered rifle it would have such kinetic energy that even if it went through soft tissue it would have set up shock waves so intense that it would have produced extensive swelling to the throat. This was not seen in JFK.

Point: It seems as if Specter is already working on a shooting scenario that will explain how a single bullet could cause both JFK's non-fatal wounds and also account for the damage done to Connally. In short, this is a precursor to the S/B theory. . . .
