Dear Mr. Berendt,

If it is not too late, please add the following to the list of 15 scientific examinations at the end of "Notes for a New Investigation."

"16. Neutron activation analysis of the bullet fragment removed from Governor Connally's wrist and the stretcher bullet, to determine whether the fragment originated in the almost-whole bullet and thus whether the single-missile/lone-assassin thesis is tenable."

I am enclosing an excerpt from my manuscript which explains the importance of such a scientific test.

Yours sincerely,

Sylvia Meagher
