RESULTS OF AUTOPSY ON JOHN F. KENNEDY

On November 23, 1963, an autopsy was performed on the body of former President JOHN F. KENNEDY at the National Naval Medical Center, Bethesda, Maryland. A total body X-ray and autopsy revealed one bullet hole located just below shoulders to right of spinal column and hand-probing indicated trajectory at angle of 45 to 60 degrees downward and hole of short depth with no point of exit. No bullet located in body.

A second bullet entered back of head and thereafter emerged through top of skull. Two metal fragments removed from brain area, the first 7 x 2 millimeters and the other 3 by 1 millimeters in size.

The above two metal fragments were turned over to Agents of the FBI for delivery to the FBI Laboratory.

A piece of skull measuring 10 by 6.5 centimeters had been flown in to Bethesda from Dallas hospital and this disclosed minute metal fragments where bullet emerged from skull.

With respect to the bullet hole located in the back, pathologist at National Naval Medical Center was of the opinion this bullet worked its way out of the victim's back during cardiac massage performed at Dallas hospital prior to transportation of the body to Washington.

With respect to this situation, it is noted that Secret Service Agent RICHARD JOHNSON turned over to the FBI Laboratory one 6.5 millimeter rifle bullet (approximately .25 caliber), copper alloy, full jacket, which he advised was found on a stretcher in the emergency room of the Dallas hospital to which the victim was taken. JOHNSON was unable to advise whether stretcher on which this bullet was found had been used for the President.

The above information was received by communication from the Baltimore Office, dated November 23, 1963.
