\*I've looked at CEs 567.569, C2.C3. Neither is anything like as clear a specimen as a hing stub. The nose part especially. If positive identification was ballistically sable from the thermought be no problem at all with the ring remnant. Especially not the nose piece, which is distorted terribly and shows no sign of foreign matter. has been a long time but I think this was my purpose in wanting these pix. IM 2/6/76
