

Note or footnote in new chapter, "The Army Protected...." where Dolce refers to all noses of bullet fired into wrists being deformed or where I refer to the Commission's not having published any picture of the 10 of 10 that were so deformed or any other place you consider appropriate. *in text*

In his excellent book, Presumed Guilty (Fairleigh-Dickinson University Press,) Howard Roffman published a Commission photograph of four test bullets all ~~of which were~~ ^{with} seriously deformed. The Commission's identification of this photograph reads: "6.5 MM Manlicher-Caraanno Bullets Recovered after being ^(Page 141) Fired Through Distal Ends of Radii of Cadaver Wrists." Roffman's caption notes that this photograph was withheld from research for eight years. It was actually classified! There was no ^{legal} ground for any such classification of any grade. Because this photograph did not qualify for classification the only reason it was classified clearly was to be able to deny access to its refutation of the entire Report and the entire official "solution" to the crime until long after there was any major attention to the controversy over the Report. It was not disclosed to Roffman until long after the fiasco of Jim Garrison's Mardi Gras "solution" to the JFK assassination, his trial of Clay Shaw having ended with a "not guilty" verdict reached by the jury in less than an hour, chilled interest in the assassination and ~~its~~ criticism of the Report. As Roffman also noted (Page 140) the one of these four bullets in ^{this "id"} the classified photograph of the four that was least deformed appears to be the only one of those 10 wrist test-fired bullets that was entered into the Commission's record ^{at} appears to be ^{Commission} Exhibit 856.

This also is the only reason Dolce was ~~not~~ not called as a Commission witness.

Can't find Howard's book. Chip gave me xerox of these two pages yesterday
