gunman."

A rifleman at the vehicle's location would have had to fire from nine feet above the ground for his trajectory to clear existing vertical obstructions, it said. No person was visible on the roof of the vehicle. Even assuming a gunman was at sufficient height, the timing of the cavalcade was such that he would have had less than one-thirtieth of a second to get off the fatal shot, Itek said.

The laboratory used a variety of techniques in studying the photographs. A method known as "dodging" produced clarity of light and dark tones. Use of color filters made them even sharper.

NIX, an employe of the U.S. General Services Administration in Dallas, took his first few seconds of film approximately 200 feet from Kennedy's car and 300 feet from the pavilion atop the knoll.

Then he ran through the crowd about 18 feet to his left and zoomed his camera in on the scene again. The resultant triangular p a t t e r n permitted stereoscopic analysis of the objects in the background and was fundamental in determining that the apparent rifleman was actually a blend of shadows.

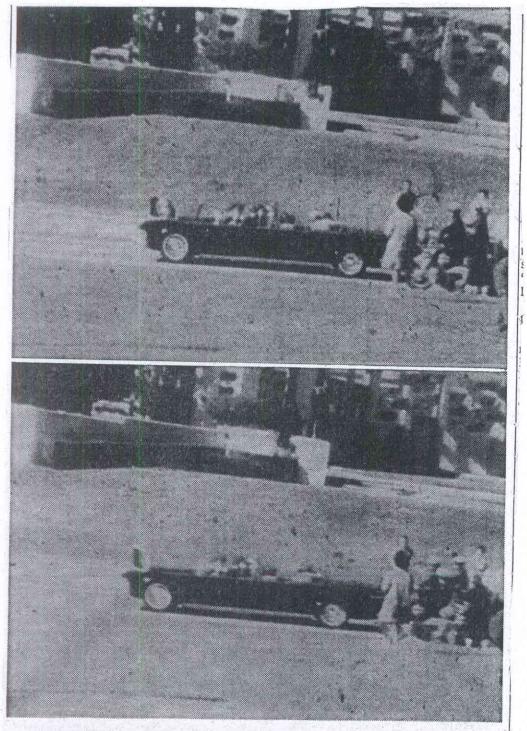

The Nix photos showed no individuals in front of the wooden picket fence in the area up to the concrete wall.

ONE of the persons who saw Kennedy shot and who is convinced that one report came from' the knoll area is S. M. Holland, a signal supervisor for the Union Terminal Co. who was standing on the railroad overpass above Elm Street.

Holland told the Warren Commission that he heard four reports and that not only did one of them come from the trees on the knoll but that he also saw a puff of smoke emerge there.

Holland's testimony had been employed by protagonists of the second gunman theory as evidence to back up the Nix film.

The independent Itek conclusions on the Nix film were in keeping with the Warren Report with one exception. The Itek study indicated that at the moment of the impact of the fatal bullet, the Kennedy automobile was about three feet farther back than the spot where the Warren investigation placed it. That finding, however, would make it even more unlikely - if not impossible - for a second gunman to have hit Kennedy from the aperture between the picket fence and the pavilion on the knoll.

UPI Telephoto

SHADOW GUNMAN—Analysis of an amateur photographer's movie of President Kennedy's assassination showed that what appears to be a rifleman on the grassy knoll (upper left in both pictures) is really a blend

of shadows. The study by Itek Corporation demolished a widely circulated theory which contradicted the Warren Commission's finding that Lee Harvey Oswald was a lone assassin.
