Dear Sir:

It is my understanding that the results of FBI spectrographic analysis tests performed on bullet fragments connected with the assassination of President John F. Kennedy have never been made public.

It is also my understanding that following completion of the tests(performed on Warren Commission Exhibits 399 and 842). the PBI informed the Warren Commission only that the bullet fragments were "similar in metallic composition".

Considering the importance of this test in determining or ruling out the existence of conspiracy in the J.F.K. case, I am writing to ask why the files relating to the spectrographic analysis have not been fully disclosed,

Sincerely,

L'hartorne

Louis P. Kartsonis

Dear Mr. Kartsonis:

This is in reply to your letter dated February 25th, which was received in my office on February 27th, regarding certain spectrographic shalyons performed in connection with the investigation relating to the assassination of former President John F. Kennedy.

The results of these stactrographic tests are contained in an FBI report dated November 30, 1963, at ballas, Texas, which has been furnished to the National Archives, and is available to the public. Additionally, the results are set forth in the report of the Warren Commission, Volume 5, pages 67, 69, 73, and 74, wherein it is specifically stated that the metal fragments were analyzed spectrographically and were found to be similar in composition.

' We are therefore of the opinion there has been full disclosure of the results of our testing in this kegard, and it is available to the public as outlined above.

incerely yours,

MAILED 7 MAR 1 4 1975
