Prime Rate Hits Record;

By James L. Rowe Jr. Washington Post Staff Writer

A number of the nation's largest banks yesterday increased their prime lending rate to 8.75 per cent, the highest that key interest charge

has ever been.

In other economic developments, the Labor Department reported that output per manhour declined slightly in the second three months of the year, while the Commerce Department reported a 1.9 per cent increase in its leading indicators index. Steady increases in this index are supposed to portend upturns in business activity while decreases foreshadow down-

Taken together, the economic reports provide contradictory evidence as to whether the economy is braking hard.

If the productivity slowdown is as severe as the statistics indicate, it is yet another heavy impetus to inflation.

Rising productivity has dampened some price rises that might otherwise have occurred, although prices have been skyrocketing, especially at the farm level, since Janu-

The boost in the prime lending rate was initiated by New York's largest bank, First National City Bank, and quickly followed by a number of other large banks including Bankers Trust and Marine Midland in New York and First Pennsylvania, Philadelphia National and Girard of Philadelphia.

The prime rate is the interest a bank charges its best corporate customers for a shortterm loan. During the severe credit crunch of 1969-70, the

for nine months.

The latest increase, which is expected to be followed by most banks throughout the nation, came as the Federal Reserve Board is pursuing an increasingly tight monetary policy but one which is failing to slow the growth in the money supply.

The Fed's discount rate, the rate it charges member banks to borrow from it, matches a 1921 record of 7 per cent.

A number of economists are convinced that real growth in the economy was much faster than the 2.7 per cesnt reported by Commerce last week. If that is the case, then the productivity decline would probably he overstated.

Productivity normally declines somewhat when industries approach full capacity, for a variety of reasons: business must put less efficient machinery in production to satisfy demand, workers may have to work more overtime hours, machinery may need more repairs at higher use rates.

The Treasury's top career economist, Herman I. Liebling, said technical questions which involve adjusting raw statistical data to account for usual seasonal changes caused the Commerce Depertment to understate real output. He calculates real growth at 5.5 per cent and productivity creases at 2.5 per cent.

Because the economy was already operating at such high capacity in the second quarter, the normal huge upswing could not occur. But the seasonal factor adjusted for it anyway and thus understated

output, he said.
