## 1/29/70

Dear Dick,

Your 26th mailing, of the 2-pp add to the 399 study and your 1/8 to HR, came this morning. It is good to write of things other than preoccupied me yesterday, the lingering effects of which I feel today.

On 399, these small suggestions: last art, appendix, rather than saying that "A" metallic fragment was deposited in the class, which may be an inadequate representation, I would take the space, in any revision, to say that after this injury was cleansed a metallic fragment was visible in post-orderative X-rays (and is not mentioned in the deport or in any of the testimony before the members of the Commission). Mether than saying, "several metallic fragments were deposited in Connelly's right wrist, I'd suggest saying that after all of his motion, and after that wound was cleansed, several metallic fragments were recovered from the wrist. Of the thigh fragment, you might want to add that its size was carefully hidden by the Commission, in both testimony and Report.

My reasons are to indicate the high probability that even this totally disqualifying degree of fragmentation acknowledged is entirely insufficient, for there is high probability other fragments were deposited and not recovered.

As you realize from my letter to J an and his to se, he did duplicate my work with the end of 399, they did take a picture for him (he says more than one), and this or any of these cannot possibly be mine. Therefore, in your consideration of my argument that more has been removed - and I am hot successing any accident, as with the Tick picture- I thick you should beer in mind that they just cannot and do not lose pictures and negatives of this stuff, nor is it likely that "ohrson has forgotten it. We had quite a business over it. You have seen his reaction when he is merely with me. I am praises for your confirmation that they had it when we were there together and for a stat of the print they sent you. Here John's disconesty may have a side benefit....I do not think enyone can underst nd now much that rotten business really sickens he, how it preys on my jongled herves.

Your letter to moward is the best and the most. When I came to your opinion, that you have trouble believing Specter is bereft of conscience, I ande a note to argue with you, but when I came to the next line, where you show awareness of his "instinct for self-preservation", we are in complete zecord, except, possibly, in degree. I think it dominates everything he did after the full ghormity of what he had done in taking the automsy testimony dawned upon him. I briefed Howard this way.

You are the first to my recollection to articule my long belief, "every time they push the panic button we benefit". I have worked on this basis for a long time and you are sware of some of the benefits. I have gone further, in ways " have not communicated to you simply because I did not want to prepare possible eavesdroupers. And your advice re' med. examiners is soimportant. It is primaps even more of a problem with me because of my nature and method. I try and engaged the interviewee in conversation, just turn min own, which requires a certain amount of communication of this hazardous kind. I tried to prepare loward, but you ut it much better than I did, and more succinctly.

I think your formulation, "I can't refutem the witnesses who sold they saw rifle and/or shooting from this window" in to bestow a credibility on this "testimony" it does not warrant. The only one to even claim to have seen shooting is history's least credible, Brennan. The "testimony" on a rifle being positively seen is so wanting the Commission had to skirt around it, as a rereading of this part of the Report will disclose. They say their conclusion doesn't rest on Brennan alone (and even Curry found aim incredible), and they follow with nothingness, Fisher and friend, Euins (Pipe thing) and Jackson, who had to have seen shooting if he saw rifle. There remains no evidence that a shot was fired from there an no credible evidence a mifle was even seen there. I think you bent too far backward here.

Lest words, p: 2"Besides, I dp not think that knowledge od the location is as important as other factors". I disagree. If we have, as I now do, positive proof they de iberately mislocated this wound, that is quintessential in several areas: how the crime was committed, how many people it required, how many shots were fired and from where and by whom, conspiracy, etc. And what more lucid exposition on the integrity of the work and those who did it, thos. who, knowing better, have been silent? On the basis of our earlier, negative knowledge, your worment can be justified but today I think it is wrong.

Though I disagree with these few things, I think it is on excellent letter which should be of great benefit to howerd.

I will be at the Archives tomorrow, but only to see something I have forced out, not connected with crything in which you have been interested. I may also skim a few documents. But I will not be there for long and will not make an issue of 399 and the bix. I would rether see your picture first and get them to take the picture I want for me, to attract no great attention to this interest. I'll then pick moved up at Bud's and we'll come mere.

If you find environg I told John unwarranted, unfair or invalid, please do tell me, as promptly as you can...I find myself wordering if he plans to use this stuff in LOOK. If he does, I'll sue them both, if ' have to be my own lawyer, as in this case - believe would be unlikely, with the written record ' have, induding his original letters. If you have any suggestions, I can use them. This is very troubling, upsetting, a further contribution to my anxieties...and I now wonder, as I did earlier, if he, in fact, might not be the source of the snide comments Lifton made that required knowledge he could have gotten only from mail interception or one of a very shall number of people telling aim. His comment did oucte John, but Lifton also fabricates this sort of thing. It is SOF with aim, for multiple reasons.

The usual heste.

Howard Roffwan Philadelphia

Ŵ

Howard: I have your letter re Specter interview and other mail, but must answer hastily. Flease excuse.

Specter interview: Do not by any means be disappointed by failure to get all that you wanted, for other things may come out of it more valuable than you think. From what is disclosed in your letter I see nothing that you did wrong under such trying circumstances. It's good that S should understand that we know far more than he thinks we know; that will trouble him, and the more troubled he is, the better it is for all. I find it difficult to believe that he is absolutely bereft of conscience: that may eventually turn him. Also there is the instinct of self-preservation which might drive him our way. In any case, I think it far better for him to know that he is cornered that that he should move in comfort. The worst that can happen is that such as Specter and others should become bored with the issue. If you did nothing else, you at least jogged his 'interest', and that is worth gold. Think of what Garrison's failure to get the autopsy material produced for us: the Panel Report and a judicial decision that the autopsy was deficient. Every time they push the panic button we benefit. There's a time to go easy and a time to so hard. xxx What you did and what you got seems just right to me -- at least in so far as it is much more than others might have managed.

Congratulations, too, on your self-control. I am not sure whether I could have maintained it. The "I don't know" about Finck's N.O. testimony was grand.

I think if you had gotten a tape of the interview, I would have been disappointed that you didn't also get a movie of Specter in action. I envy you.

Perhaps you understand now why I raise my **EXEX** eyebrows at knowledge that Specter waxed Thompson in is debate -- or even that Specter agreed to debate Thompson. I find it hard to believe that he would agree to debate unless he knew beforehand that he was going to win.

Helpern's remarks: Information about "deer rifle" is insufficient for the reasons that you mention. If indeed the equipment was such as the shooter normally used on deer, then he used a soft-nosed mushrooming bullet that could have an explosive effect on a human skull. Many factors come into play, and definite determination is not possible without more info than Helpern gives.

Phila. medical examiners: Go easy, especially at first, and learn how much criticism of autopsy does they can take without rushing to their defense. I would give this advice even if they were not acquainted with Finck and the others-- the moreso since they are. MDs protect each other almost by instinct. It's best to disclose informations and let them come to conclusions. If they are inclined to be co-operative and not care where the ohips fall, then you can probe further. First find out what they are like, then determine how far you can gc. By my own experience, often to my eventual disappointment (and something experienced by others), I know that there is a terrible under to show how much you know. If you have that feeling-- and you do, if you are like me-- by all deans resist it. You'll sense it when suddenly you realize that you are lecturing to the person whom you are supposed to be interviewing. I succumb to this often, and it's bad news for anybody who wants to get information. On many occasions I have cheated myself out of thinks I wanted to know-- mostley because I was more interested in showing persons what I knew than in learning what they knew.

I mention this affliction of mine in the hope that you won't allow it to become yours.

<u>Lung bruises:</u> I do not understand what is behind this remark in your 22 Dec letter to Herold: "Morgan's letter now shows us what caused that bruise-- it was the fragments that they observed there (in the neck)". How does **think** Morgan's letter show this? If you refer to the A-P X-ray view of the fragments, I don't see how it bears. The A\*P view cannot show the degree of penetration of these fragments, though that is important to know

That bruise interests me, for reasons which I believe I explained in a previous letter.

Bunching of JFK coat: I do not regard the matter very important, and won't engage in argument over it. The picture in Curry's book coes not "prove" that JFK's coat was bunched when he was on Elm St.; it does, however, indicate the probability that it was bunched on Elm.

## 

Shots from TSBD window: I don't asser the impossibility of maximum some shooting originating from here. I would argue against the possiblility of an M-C wifle firing as many as three shots fromhere: one shot, maybe; two shots, very unlikely; three shots, impossible. Reasons are essentially what you suggest: the set-up of boxes, half-open window, and other topographical features get in the shooters way.

I can't refute the witnesses who said they saw rifle and/or shooting from this window, so I tend to think that one shot may have originated from here.

The full explanation requires demonstration of how you have to move in that set-up, and I don't have time to go over it.

Impossible to fire any shots toward Elm throught the area to the right of the boxes-- there is no view of Elm through that side, except directly in front of the window; no engular view.

Behind fence in Willis and Betzner: 1'll have to check your observations more carefully than I have. Offnand, however, I would say that even if you have correctly interpreted the pictures, there is not enough to make a case. It's the sort of thing you sit on, and keep in the back of your head until you can corroborate or refute it.

Location of JFK back wounds: Kellerman, Greer, Hill do not give definite designations and can do no more than indicate that there is confusion in an area where there ought not to be any.

l don't think that the present state of info allows definite determination.

Besides, I do not think that knowledge of the location is as important as other facts.

## XXXXXXXXXXXXX

Book by "English doctor":Forensis Medicine: .303 caliber can pulp brain and smash cranium-- even the military rounds. Much depends on the optarget velocity and other things. It is a much faster bullet than 6.5mh K-C, abart. xubent above 2500 feet per sec. muzzle velocity. I think. What "English dector" says about bullet disintegration at

What "English doctor" says about bullet disintegration at ranges less then 300 yards is pure grap-- if, as I suppose, he refers to military rounds. Doctor is a quack in this regard. If a military round does not strike bone, it does not fragment. If a military bullet strikes hore, and if the on-target velocity is high, then it might break up by separating from the jacket and dispersing in several relatively large chunks, with perhaps some very amail fragments.

The 1895 article refers to the type of bullet represented by such as 399. Befeore the development of jacketed bullets, bullets were lead or lead alloy. The jackets held the lead together and let it pass into body without producing excessive priferal damage; more "humane" wounds result.

To understand the difference you've got to see the wounds that different bullets produce at variousranges. Recently I saw the pelt of a wolf that had been hit by a .270 hollow point in the shoulder. The hole was so big that you could stick your head through it -- literally. That .270 slug disintegrated on the shoulder and did not penetrate far into the animal; the other side of the pelt was intact.

Varminting bullets: the 48 gr bullet fired at 4500 fps proably is the caliber known as .220 Swift. It's the fastest hunting caliber that there is. Used almost exclusively for varmints, tho some foolishly use them on deer -- they are not designed for deer.

Eliminating ricochet is a periferal advantage of the high velocit varminters; that is not the reason why they are designed that way. They are designed to kill small animals instantly without regard for the preservation of the animal's flesh or pelt. Since these animals are not hunted for food, hunter wants an instant kill to **maxmersists** be certain. Hunters who want to eat game try to use ammo that does not destroy much meat. The fact that varminters seldom ricochet is a gratifying side effect, but not the reason why these are so designed.

I have other correspondence to get to, and a bad day of classes to prepare for tomorrow. So long.

Still.
