

Report of the Warren Commission, NY Times edition, October 1964

page 98, in part :

" All the evidence indicated that the bullet found on the Governor's stretcher could have caused all his wounds. The weight of the whole bullet prior to firing was approximately 160-161 grains and that of the recovered bullet was 158.6 grains. "

page 105, in part :

"..... Referring to the President's neck wound and all the Governor's wounds, Dr. Dziemian testified: ' I think the probability is very good that it is, that all the wounds were caused by one bullet. ' Both Drs Dziemian and Olivier believed that the wound on the Governor's wrist would have been more extensive had the bullet which inflicted that injury merely passed through the Governor's chest, exiting at a velocity of approximately 1,500 feet per second. Thus, the Governor's wrist wound suggested that the bullet passed through the President's neck, began to yaw in the air between the President and the Governor, and then lost more velocity than 400 feet per second in passing through the Governor's chest. A bullet which was yawning [ho-hum] on entering into the Governor's back would lose substantially more velocity in passing through his body than a pristine bullet."

page 107, in part :

" From the initial finding that (a) one shot passed through the President's neck and then most probably passed through the Governor's body, (b) a subsequent shot penetrated the President's head, (c) no other shot struck any part of the automobile, and (d) three shots were fired, it follows that one shot probably missed the car and its occupants."

Diagrammatic sketch of bullet's trajectory emanating from rifle at sixth floor window, causing wounds to the President and Governor and subsequently being found on a stretcher in the hospital
