As I pointed out in MAITEWASH, the FBI does not account for the wound in the front of the Fresident's mck. It is entirely unmentioned in the Summery Report of December 9, 1965, and is only hinted at in the Supplementery Report of January 13,1964, where there is an inaccurate reference to the demage to the front of the President's shirt, without reference to any underlying wour wound. It says that this "had the characteristics of en . exhit hole for a jrogectile", does not describe or even hint st what projectile, whether a fragment of a bullet or a fragment of bone (and FBI firearus ! Expert Hobert & Frazier testified he could say only that this was consistent with an exit only of no one had touched the garments). Internal evidence is that this report was prepared with the FBI in possession offithe eutopsy report, which it seems to quote, yet it does not say of the nonfatel injary what that report does and it does sey of the reer non-fatel wound what that report does not sey, that it was in the back and "had pen trated to a distance of less than a finger' length".
