

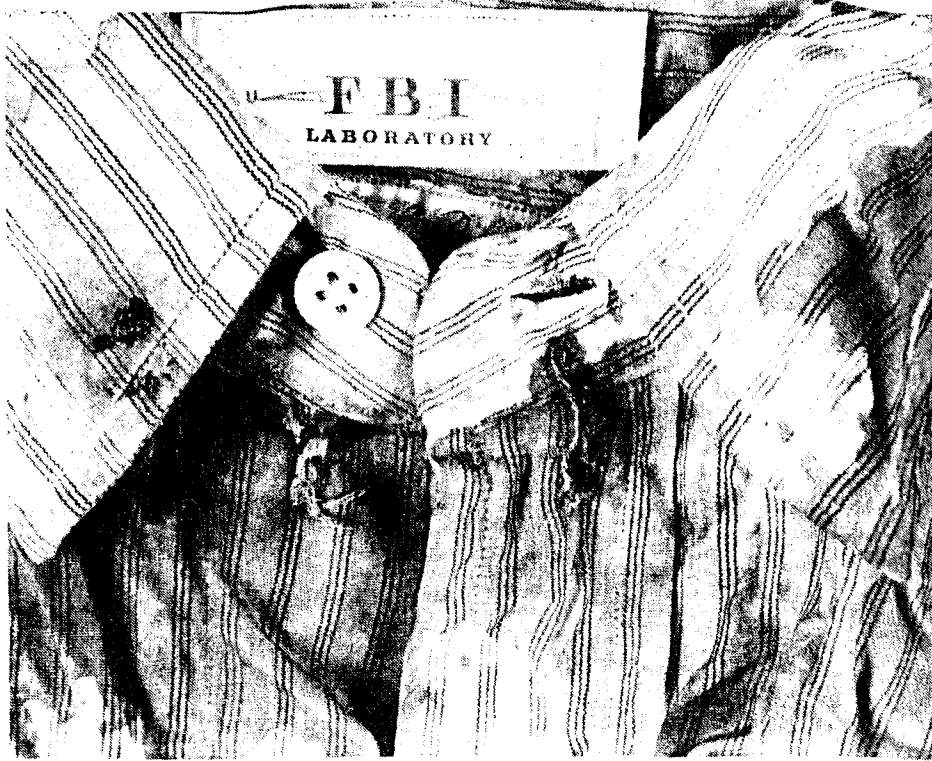

Exhibit 44

This is an actual FBI print, not from the Warren Commission's files, obtained as described in Chapter 30, especially beginning on p.328. It has this caption typed on the back: "Photograph depicting portion of Exhibit 60." It is less clear as part of FBI Exhibit 60 (p.597) but in even that form shows much more than any picture the Commission dared print. In itself this picture, presented here for the first time anywhere, destroys the entire Warren Report and means the falsity could not have been accidental. It shows not bullet holes but slits. It also shows that when the shirt is buttoned they do not coincide and on this added basis could not have been made by a bullet. Note that the slit on the button side is entirely below the neckband while that on the buttonhole side extends well up onto it. The FBI and the Commission both knew their representations were false. The Commission blundered into the truth separately when Dulles asked Dr. Carrico where the President's front neck wound was and Carrico told him it was above the shirt. Carrico confirmed this to me when he also confirmed the obvious, that this damage to the shirt was done when the necktie was cut off by nurses under his supervision during emergency treatment.
