## Mind-Drug Tests a Federal Project for

By JOSEPH B. TREASTER

American military and intelligence officials watched men with glazed eyes pouring out rambling confessions at the Communist purge trials in East. ern Europe after World War II. and for the first time they be-gan to worry about the threat of mind-bending drugs weapons.

Then, a few years later, came the reports of American G.I.'s being brainwashed in Korean prison camps.

"Here were people who had "Here were people who had stood up against the Nazis, suddenly standing up and confessing everything to the Communists," one employe of the Central Intelligence Agency recalled the other day. "For the first time, our prisoners of war were denouncing their own country. What in the world was going on?"

No one in the United States knew for certain. So, as the story is now told, the C.I.A. began investigating a wide variety of then little-known, mind-altering drugs, including LSD, which is lysergic acid diethylamide, and trying them out on human beings. So did the Army, the Navy and, eventually, the Air Force.

In the two months since the Rockefeller Commission first disclosed the C.I.A.'s experi-ments with LSD, there have been many fragmentary reports on drug testing in the militaryintelligence community.

From these reports, and new information turned up in interviews and other research, there emerges the story of a vast government program ranging over nearly a quarter of a century, a program that, primarily in the name of national security, subjected more than 4,000 persons to such psychochemical drugsas LSD, marijuana and a number of other chemical compounds that could prohallucinations, euphoria and hysteria.

## Government in Vanguard

The story is one of a Federal Government that played the role of foremost pioneer in research on a family of drugs that in the ninteen-sixties found their way into the streets. of America as the seeds of a new counterculture.

It is a story, also, that makes clear that the intent of the drug experiments went beyond Government's contention that they were merely defensive in nature, aimed at learning how or when an enemy was using the compounds and how to protect against them. In fact, there is ample evidence that military and intelligence planners hoped to add these drugs to the United States' arsenal of offensive weapons. The Rockefeller Commission

reported, for example, that the

op-C.I.A. considered several erational uses outside United States.'

And in the late 'fifties there were a number of references in military publications to psy-chochemicals as "incapacitating agents" that could be used to knock out an enemy for a few hours or a few days without doing permanent damage, a concept that one retired general the other day called, "winning without killing."

Included in the commission's disclosure of the C.I.A.'s drug experiments earlier this sum-mer was an account of the death of a man who had jumped from a New York City hotel window after having been surreptitiously given LSD. As the identity of the victim,

Frank R. Olson, became known, and as other details of the incident emerged, servicemen and civilian researchers who had participated in military drug experiments began telephoning newspapers and television sta-

## Several Projects Confirmed

At first the armed forces refused to comment, but eventually spokesmen confirmed several drug projects. In the smallest, and apparently the only effort not directly related to mili-tary activity, the Navy said it conducted a single study with 20 persons between 1950 and 1951 to evaluate the therapeutic value of LSD in treating severe depression.

The C.I.A. and the Army, which was the principal re-searcher for the Department of Defense, say they discontinued their LSD experiments on hu-mans in 1967, but the Army says it went on with other drugs that could cause hallucinations until about two weeks ago. In addition, the Air Force says it continued to sponsor university research in LSD through 1972. Civilian scientists and medi-

cal researchers generally agree that there probably was good reason to test these drugs on humans—given the perceived threat and the fact that there existed no alternative means of determining the impact of the psychochemicals on men. But

they have been extremely ciritical of the procedures followed by the C.I.A. and the Army.

In most of the C.I.A.'s experiments with LSD, the Rockefeller Commission report said, the subjects were unaware that they were being administered shows, and there was no indi-the drug—a practice that Dr. cation that the C.I.A. had con-Judd Marmor, president of the ducted a followup on any of American Psychiatric Association, says he considers unethical and dangerous.

Dr. Marmor, the head of

Ine standard ethical procedure in human experimentation in the United States is to obtain prior informed consent from subjects. There is a danger, especially with such a potent psychochemical as LSD, well invalidate the experimental manner in the subject everything you might well invalidate the experimental series of the subject experiments. The standard ethical proce-

that an unsuspecting subject ers believe.

Despite the death of Frank Olson, which occurred in the fall of 1963, apparently not long after the C.I.A. began experimenting on humans with LSD, the agency continued to administer the drug to unsuspecting subjects for 10 more years, the Rockefeller Commission reported.

The agency's Inspector General learned of the practice, questioned the propriety of it, and called a halt, the commission said, but the C.I.A. did not sion said, but the C.I.A. did not finally abandon its test with these drugs for four more years. During that time, the subjects were allegedly in-formed volunteers at various correctional institutions.

The wife and three adult children of Mr. Olson, who for 22 years had been in the dark about the apparent motivating factors in his death, have taken the first steps toward suing the C.I.A. for what they call the "wrongful death" of the head of their family.

David Kairys, one of the law-yers for the Olsons, says his firm, Kairys & Rudovsky of Philadelphia, has also taken on the case of the survivors of a marine colonel who fatally shot himself nine years ago after a C.I.A. job interview in which he later said he believed he had

been drugged.

The Army says it administered experimental drugs only to persons who had volunteered "without the intervention of any element of force, fraud, deceit, duress, over-reaching or other ulterior form of constraint or coercion." The volunteers, however, were rewarded, with three-day passes every weekend and given an extra

\$45 a month in temporary duty pay.

The volunteers were told, the Army says, that they were be-ing given a "chemical compound which might influence their behavior," but they were not told before or after the test the specific name of the drug, such as LSD, or that it might cause them to hallucinate or to feel panic or discomfort.

Follow-up studies were done on only a handful of the mili-tary men tested, an inquiry over the last three weeks

Dr. Marmor, the head

will suddenly feel he is losing Almost 25 Years tempt suicide, many research ers believe

Dr. Van M. Sim, who was director of the Army's program of testing drugs on humans for 22 years, and is now being investigated for alleged misuse of the pain killing drug Demerol before he came to the military, used the same rationale in explaining his methods in a recent news conference, saying that to provide more in-formation to subjects might prejudice the experiments.

Dr. Marmor said that in the Army tests there apparently had been "some consent and there was some prior knowledge. And that kind of preparation gives an individual some kind of protection. What I'm concerned about is an in-

dividual quite unsuspectingly given a drug."

Representative Downey, a Long Island Demo-crat who has called for a Congressional inquiry into the issue, says he finds it "inexcusable" that the Army did not tell its subjects what drug they had received after the experi ments so that, in the event of aftereffects, they might have some sense of what was happening.

He is disturbed, too, that there has been no substantive follow-up of the Government

test subjects.

Dr. Sim said in an interview at his home in Bel Air, Md., near the Edgewood arsenal, that on its own initiative the Army had done a follow-up in 1971 on two men who had re-ceived LSD, and 38 who had received other drugs, and had not been able to distinguish between those subjects and a control group that had received no drugs.

He said he had felt the sam-

ple was too small, and that he was not entirely confident about the follow-up techniques employed, but he said he didn't have at his disposal enough money or medical officers to expand and continue the followup "and nobody seemed par-ticularly interested in this." Dr. Sim said he and his staff

had themselves taken all of the drugs being tested, and he said since neither he nor the others had experienced any trouble-some aftereffects, 'we didn't expect the other men to feel

anything either."
In 1972, a retired Army lieutenant colonel, William R.
Jordan, who said he had been

The Army initially turned the colonel down but later reversed itself after Senator Lawton Chiles of Florida wrote a letter

in his behalf.

In the ensuing followup the In the ensuing followup the Army said it was ableto find only 27 of the 34 men. One had been killed in Vietnam, seven reportedly said they were not interested, and 19 were examined for two to five days each and finally given a clean bill of health.

The Army new saws is with

The Army now says it will attempt to follow up on all of the servicemen it has given the drug, a total of 585 of the more than 3,000 men who participated in the over-all drug pro-

Most of the others had received drugs that can cause hallucinations, but the Army said it had no plans to follow up on these men. Even in dealing with only about 600 men, Dr. Sim said he thought the effort would take years, and some Army doctors expressed skepticism that any meaning-ful results would be achieved. The Army said it had no intention of attempting to get in touch with the approximately \$60 civilians who were given 100 civilians who were given LSD in Army-spansored experiments at the University of Maryland, the University of Washington and the New York Psychiatric Institute.

The Air Force said it Mississe was not planning to review the health of the 168 civilians who took 4.50 in studies, it paid for at More York University, Duke University, the University of Minnesota, the Missouri Institute of Psychiatry at the University of civilians who were give

chiatry at the University of Missouri in St. Louis, and the Baylor University College of Medicine at the Texas Medical Center in Houston.

in addition to those gives LSD by the military and intelligence organizations, the Maintail Health said that it had conducted tests on more than 3,000 volunteers — prisoners, imental patients and other civilans — for 15 years ending in 1968 in an effort to determine the drug's medical value, particularly in treating psychiatric disorders and shronic alcohel-

The Food and Drug Administration said its records showed that 170 research projects with LSD had been approved over the last 10 years, but that only six were currently under way at five institutions, including the Veterans Administration Hospital in Topeka, Kan,

The V.A. program, according to officials of the agency, in-volves an average of two careOther Tests Listed

The other research, a spokesman said, is being done at the Vista Hill Psychlatric Founda-Vista Hill Psychiatric Founda-tion in San Francisco, the Medi-cal College of Birmingham in Birmingham, Ala., the Langley Porter Neuropsychiatric Insti-tue in San Francisco and the Maryland Psychiatric Institute in Baltimara which in Baltimore, which has two projects.

Dr. Sim said he knew of no cases in which participants in the program he directed at the Edgewood Arsenal in northeast Maryland had suffered serious consequences, nor had he heard of any adverse reports concerning the subjects in the experi-ments carried out for the miliments carried out for the infinitery at universities and re-search centers.

However, the Rockefeller Commission said that in a num-

ber of instances, subjects in the C.I.A. experiments became ill for hours or days after being given the drug and that one person had been hospitalized.

The commission said the details of the hospitalization and many other aspects of the C.I.A.'s drug testing could not be learned because all of the records concerning the program a total of 152 separate files had been ordered destroyed

in 1973.
Commission sources say that the chief of the C.I.A. drug testing program, Dr. Sidney testing program, a 37-year-old biochemist who was personally involved in the fatal experiment in 1953, ordered the destruc-tion of the records in an apparent effort to conceal the details of possibly illegal action. Dr. Gottlieb is reportedly in India.

Psychochemicals Defended

Arguing in favor of using psychochemicals as offensive weapons in 1959, Maj. Gen. Marshall Stubbs, the then chief chemical officer of the Army, wrote in the October issue of The Army Navy Air Force Journal:

"We know the concept is feasible because we have run

tests using a psychochemical on squad-sized units of soldier volunteers. They became con-fused, irresponsible, and were unable to carry out their missions. However, these were only temporary effects with complete recovery in all cases."

The Army says it never pre-pared large quantities of LSD for offensive use and that it discontinued experiments with the drug in 1967 because "all necessary work to define the chemical warfare threat from this compound" had been completed. Several other military sources, however, said the Army stopped work with the drug because its effects were regarded as too unpredictable.

A few years earlier, the Army adopted a psychochemical that

fully selected mental patients; it calls BZ as its standard inreported yesterday. The patients; capacitant, and a department
reported yesterday. The patients; have been hospitalized for longperiods and have not responded to other treatment, the V.A. senal in Arkansas. So far, the

name is 3-quinuclidinyl benzi-late, has been used only in experiments. Like LSD, BZ is a derivative of lysergic acid.

An Army training manual lists the symptoms caused by BZ as dry, flushed a kin, urinary retention, constipation, headache, giddiness, hallucination, drowsiness and, sometimes, maniacal behavior, Also, researchers say loss of balance and inability to stand or walk.

Dr. Sim said that most of the military drug testing took place at the Edgewood Arsenal in laboratory conditions, after the subjects—mostly soldiers, but also some airmen— had gone through a week of medi-cal, psychological and psychi-

But he said that he and staff members had also done field testing with military volunteers at several installations in the United States.

In the United States last week to attend a scientific, meeting, Dr. Albert Hofmann, the Swiss chemist who accidently discovered the hallucinogenic effects of LSD in 1943, said he had begun working with lysergic acid, in hopes of developing a stimulant for circu-lation. He was unhappy, he said, that LSD had ever been considered as a tool of war.

"I had intended to prepare a medicine," Dr. Hoffman

Army says, BZ, whose chemical

examinations.
