

CHOICE MAGAZINE January 1989

REASONABLE DOUBT: The Single-Bullet Theory and the Assassination of John F. Kennedy. Director/Producer: Chip Selby. (Dist. by CS Films, Box 174, College Park, MD 20740) 1988. Videocassette \$325.00 51 min.

"Reasonable Doubt" offers considerable evidence that skepticism concerning the Warren Commission's finding - that Lee Harvey Oswald acted alone in assassinating President Kennedy - is well founded. This video argues convincingly that the physical evidence in the Kennedy assassination, as measured by modern forensic science, does not support the conclusion that Oswald acted alone. No outrageous claims as to the nature of a possible conspiracy against the President are made. The tape presents a considered analysis of the fundamental facts of the assassination, especially regarding the nature of the wounds sustained by President Kennedy and Governor Connally, and the condition of the bullet alleged to have struck both men. One need not be an assassination buff or a conspiracy freak to find persuasive the evidence presented by Dr. Cyril Wecht, longtime critic of the Warren Report and well-established forensic scientist, as well as by other experts, that the Warren Commission's conclusions are erroneous at best. The presentation, essentially nontechnical, is provided with ample footage from a number of film archives, including the famous Zapruder film of the actual assassination. Video and audio quality are excellent. Other films on this topic are available, such as "The Assassination of President Kennedy" (Phoenix/BFA, 1980), but "Reasonable Doubt" may be the definitive film video on this subject for many years. Highly recommended for academic collections, and also well suited to many general collections.
