6. Inspection of the scene of the assassination. was made.

As a result of these efforts it is concluded that the wounds indicate that both of the two bullets which struck the President were fired from a position to the rear of and above the level of the President as stated in the pathological examination report (page 6, paragraph 2 under Summary) signed by J. J. Humes, Cdr., MC, USN; J. Thornton Doswell, Cdr., MC, USN; and Pierre A. Finck, Lt. Col., MC, USA. A more precise determination does not appear to be warranted by the pathological aspects. Consideration must be given to unknown factors such as the exact position of posture, both horizontal and vertical, of the President, at the instant each of the projectiles entered his body; the speed and force of the bullets; the incline and speed of the automobile in which the President sat; the probable deflection of the missiles in the body after entrance, and other variables.

The probable trajectory has been tentatively established by other evidence and circumstances which are reported elsewhere. The Federal Dureau of Investigation laboratory has identified the bullets which struck the President as having been fired from a 6.5 mm Carcano Italian military rifle which was found in the northwest corner of the sixth floor of the Texas School Book Depository Building. Three empty 6.5 mm shells found on the floor at the southeast corner of the same building have been associated with the rifle. The Dallas Police Department has identified fingerprints of Lee Harvey Oswald on the same rifle and on cardboard cartons found at the window near the location of the empty shells.

A plat of the assassination scene, forwarded to the Chief on 12-10-63, was prepared by Robert H. West, Dallas County surveyor, and it indicates the probable trajectory of the bullets.

Malcolm O. Perry, Assistant Professor of Surgery, Southwestern Medical School of the University of Texas, and Attending Surgeon at the Parkland Hospital, when interviewed on 12-11-63, expressed the opinion that the first wound, in the President's neck, would not have been fatal. The missile path of this wound is from the upper right posterior thorax to the exit position in the low anterior cervical region and is in slight general downward direction and from the right rear neck to center neck in front.

The path of the second bullet which struck the President (the third bullet fired) was from the rear portion of the skull in the right occipital region through the right parietal region. As far as this wound is concerned, only the direction of the missile can be ascertained, i.e. from the rear. The exact exit point of portions of this bullet is unknown.
