Mr. Howard G. Boker Production Service Manager Winchester-Western Division Olin Mathleson Chemical Corporation East Alton, Illinois 62024

Dear Mr. Boker:

Concerning the 6.5 millimeter Manniicher Carcano ammunition manufactured by the Western Cartridge Company during World War II, is it possible that the same lead alloy used in making the cores and the copper-zinc jacket material cwuld have been used in the manufacture of other types of rifle ammunition? What I am trying to determine, is whether or not the use of those specific alloys used in manufacturing the 6.5 Carcano builets, ceased to be used after the contract was filled, or if the balance was then used to manufacture builets of other calibers. It is of great interest to me as to whether the composition found in these particular metals could be found in other rifle ammunition.

Any information you may be able to provide along these lines will be very much appreciated. Thank you.

Sincerely,

Emory L Brown, Jr.
