BLOODSTAIN

PATTERN

ANALYSIS

Coalition on Political Assassinations

1995 National Conference

Bloodspatter analysis is the study of the fixed results of blood disbursed as the result of force impacting blood. One example is the high velocity, forceful impact spatter pattern. This type of pattern is most commonly created as the

Back spatter is created as blood is forcefully expressed from an entry wound, back toward the source of the energy as the result of increased pressure within the tissues, and is associated with entry wounds.

or less.

droplets resembling an atomized spray or

indicates a multitude of minuscule blood

result of a gunshot injury. Analysis

mist are disbursed, with the majority of

the stains having a diameter of . 10 mm

Forward spatter is blood which travels in the same direction as the source of the projectile and is associated with gunshot exit wounds.

gunshot fired from the right front a single projectile, resulting in an injury Kennedy was the result of a single that the head injury to President in the Zapruder film, it is my conviction on the scene, and blood spatter recorded witnesses observing the shooting of President Kennedy, documented blood descriptive statements of blood by with an entry and exit wound. Based on on the film is consistent with back spatter displayed in the Zapruder film is spatter and forward spatter, created by Additionally, the blood spatter captured high velocity injuries such as a gunshot consistent with the spatter created in professional opinion that the blood Based on the study of research performed in this field, it is my
