

Scott Stinger

There are two slit-like defects on the front of the shirt put the House ^{select} committee on Assassination fails to say how they both got there. If this were on exit wound how could a bullet produce 2 slit like defects on different areas of the shirt. an exit shot would make only one slit like defect, not two.

Also they mention the defect in the knot of the tie, but the lining in the tie is not damaged. How could that happen if the bullet is suppose to be coming from behind the knot of the tie. The fact that no bullet matter was found is also odd. ~~Some~~ The HSCA says the nick on the tie may have been caused by the projectile after it had passed through the front of the shirt. Well, if it didn't then the theory that the HSCA is saying is wrong. How else could the nick on the front of the tie gotten there.

The facts do do not seem apparent and the report by the HSCA about Kennedy's ~~is~~

shirt collar still do not
answer all the questions.

One would think a bullet
hole could be ~~seen~~ called an
exit or entry after the examination
of fibers in the shirt and size and
location of tears in the shirt.
