Warren Commission said there was a hole in President Kennedy's Adams apple. They also said there was a hole in the necktie he was wearing. They insist these holes are from the same bullet. There is no way the 2 holes can be from the same bullet because the Adams apple is above the knot of the tie. They suggest that the hole in the shirt has characteristics of an exit hole for a projectile. Not only that but they repeat the statement three times over that the nick in the tie may have been caused by the projectile after it passed through the front of the shirt which is an assumption that it is an exit hole. They mention that the threads around the hole are bent outward which also could assume an exit hole. So to this point they seem like they are definitely persuaded that the hole is an exit hole. And then they come up with this statement which seems like they are contradicting their so-called ~~some~~ findings. "The panel itself cannot assess evidentiary significance to the fiber direction because of the numerous intervening examinations". In other words there were so many different examinations, ~~and~~ but none were really significant. So why assume an exit hole?
